

AMENDMENTS TO THE SPECIFICATION

The following a proposed amendment to the substitute Specification submitted on 14 January 2010.

[0042] Embodiments of the above-described methods may be implemented on standard computer hardware by installing software embodying aspects of the invention. The data carrier carrying the program code (e.g., computer executable instructions) may comprise a non-transitory computer readable medium, such as a disk (CD - or DVD-ROM), programmed memory such as read only memory (firmware), volatile or non-volatile random access memory (RAM), etc. However, the data carrier cannot be implemented as pure electrical signal. The program code (e.g., the computer executable instructions) can be accessed and executed by a processing unit (e.g., one or more computer processors).
